

# PowerFlex 700 Drives to PowerFlex 750-Series Drives

## Important User Information

Read this document and the documents listed in the additional resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice.

If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

**WARNING:** Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

**ATTENTION:** Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence.

---

**IMPORTANT** Identifies information that is critical for successful application and understanding of the product.

---

Labels may also be on or inside the equipment to provide specific precautions.

**SHOCK HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.

**BURN HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.

**ARC FLASH HAZARD:** Labels may be on or inside the equipment, for example, a motor control center, to alert people to potential Arc Flash. Arc Flash will cause severe injury or death. Wear proper Personal Protective Equipment (PPE). Follow ALL Regulatory requirements for safe work practices and for Personal Protective Equipment (PPE).

**Notes:**

## Overview

The purpose of this publication is to assist in migrating a PowerFlex® 700 drive to a PowerFlex 750-Series drive. This publication contains these chapters:

- **Chapter 1: Drive Selection Considerations**  
Compares the features of the PowerFlex 750-Series drives to the PowerFlex 700 drive.
- **Chapter 2: Analog Speed Follower and Preset Speed**  
The control wiring and parameters of the PowerFlex 700 drive analog speed follower and preset speed are compared to the PowerFlex 753 drive (with main control board I/O) and the PowerFlex 755 drive (with optional I/O module).
- **Chapter 3: Network Communications**  
Provides information on the PowerFlex 700 20-COMM network options that can be migrated to the PowerFlex 750-Series drives and the dedicated communications options available in the PowerFlex 750-Series drives.

## Drive Selection Considerations

The differences between a PowerFlex 753 drive and PowerFlex 755 drive must be considered when selecting a PowerFlex 750-Series drive as a replacement for a PowerFlex 700 drive application.

### Available Slots

The PowerFlex 750-Series drives are designed with a slot-based architecture allowing customization with available option cards. The PowerFlex 753 drive is equipped with three slots and the PowerFlex 755 drive has five slots.

### Factory Installed Options

No options can be factory installed on the PowerFlex 750-Series drives. All optional accessories are customer installed.

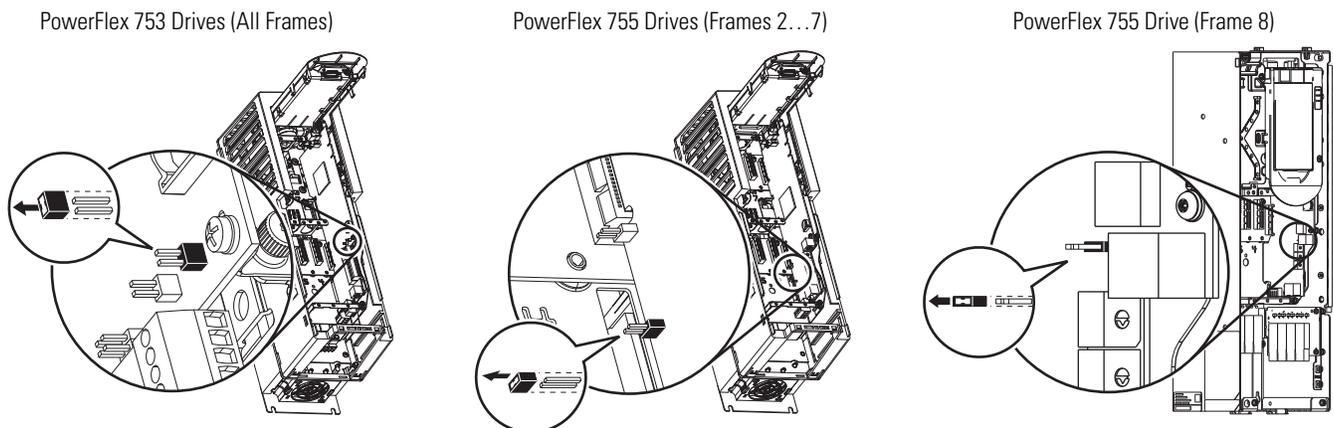

### Hardware Drive Enable

Digital input (DI) 6 on the PowerFlex 700 drive can be programmed for any available digital input functions including Enable. The PowerFlex 700VC has a hardware enable jumper on the main control board that can be removed to force DI 6 to act as hardware enabled with no software interpretation.

Digital Input 0 on the PowerFlex 750-Series drives can be programmed for any available digital input functions including DI Enable. A hardware enable jumper on the main control board can be removed to force DI 0 to act as hardware enabled with no software interpretation.

The following figure shows the hardware enable jumper locations.

**Figure 1 - Hardware Enable Jumper Locations on PowerFlex 750-Series Drives**

## Specifications and Features

When selecting a PowerFlex 750-Series drive to replace a PowerFlex 700 drive, you must consider the features and differences between the PowerFlex 753 and PowerFlex 755 drive. The specifications and features listed are those available for the products at the time that this migration guide was published.

(1) All dimensions are IP20, NEMA/UL Type 1 unless specified otherwise.  
 (2) All dimensions are IP20, NEMA/UL Open type unless specified otherwise.  
 (3) Height dimension shown for a drive mounted in a cabinet; height dimension is 976.5 mm with required junction box if not cabinet-mounted.  
 (4) Frame enclosure is IP20, NEMA/UL Type 1 MCC style.  
 (5) The depth can be either 600 mm or 800 mm for 20G, frame 8, 9, and 10 depending on enclosure code.

(1) All dimensions are IP20, NEMA/UL Type 1 unless specified otherwise.  
 (2) All dimensions are IP20, NEMA/UL Open type unless specified otherwise.  
 (3) Height dimension shown for a drive mounted in a cabinet; height dimension is 976.5 mm with required junction box if not cabinet-mounted.  
 (4) Frame enclosure is IP20, NEMA/UL Type 1 MCC style.  
 (5) The depth can be either 600 mm or 800 mm for 20G, frame 8, 9, and 10 depending on enclosure code.

(1) Maximum/minimum sizes that the terminal block will accept—these are not recommendations.

(2) Refer to the terminal block label inside the drive.

(3) External control power: UL Installation-300V DC, ±10%, Non UL Installation-270...600V DC, ±10% (0...3 Frame-40W, 165 mA, 5 Frame-80W, 90 mA).

(4) An auxiliary control power supply, such as the 20-24V-AUX, can be used with 400/480 and 600/690 volt drives with Vector Control. However, consult the factory before using an auxiliary power supply in these instances. **Important:** The auxiliary control power supply must not be used with any Standard Control drive or any 200/240V PowerFlex 700 drive, Standard or Vector Control.

(1) **Important:** Motors with NEMA MG1 Part 31.40.4.2 inverter grade insulation systems are recommended. If you intend to connect a motor that is not rated inverter grade, refer to Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives, publication [DRIVES-IN001](#), for recommendations.

## Control Terminal Comparison

## Input/Output

The PowerFlex 700 drive has standard I/O embedded on the main control board. The voltage of this I/O can be determined by the catalog string position 'k'. See [PowerFlex Drive Catalog Numbers on page 52](#). The PowerFlex 755 drive contains one digital input on the main control board and uses the optional 750-Series I/O Modules for additional I/O. The PowerFlex 753 contains some I/O resident to the main control board and also uses optional I/O.

- (1) **Important:** 0-20 mA operation requires a jumper at terminals 17 and 18 (or 19 and 20). Drive damage may occur if jumper is not installed.
- (2) Contacts in unpowered state. Any relay programmed as Fault or Alarm will energize (pick up) when power is applied to drive and deenergize (drop out) when a fault or alarm exists. Relays selected for other functions will energize only when that condition exists and will deenergize when condition is removed.
- (3) A 10 k Ohm, 2 W burden resistor must be installed on each digital input when using a triac-type device. The resistor is installed between each digital input and neutral/common.
- (4) These inputs/outputs are dependant on a number of parameters. For more information, see Chapter 3, Programming and Parameters, in the PowerFlex 700 AC Drives User Manual, publication [20B-UM002](#).
- (5) Differential Isolation - External source must be maintained at less than 160V with respect to PE. Input provides high common mode immunity.
- (6) 150 mA maximum Load. Not present on 115V versions.

- (1) **Important:** 0-20 mA operation requires a jumper at terminals 17 and 18 (or 19 and 20). Drive damage may occur if jumper is not installed.
- (2) Contacts in unpowered state. Any relay programmed as Fault or Alarm will energize (pick up) when power is applied to drive and deenergize (drop out) when a fault or alarm exists. Relays selected for other functions will energize only when that condition exists and will deenergize when condition is removed.
- (3) These inputs/outputs are dependant on a number of parameters. For more information, see Chapter 3, Programming and Parameters, in the PowerFlex 700 AC Drives User Manual, publication [20B-UM002](#).
- (4) Differential Isolation - External source must be maintained at less than 160V with respect to PE. Input provides high common mode immunity.
- (5) 150 mA maximum Load. Not present on 115V versions.
- (6) For more information, see the Auxiliary Control Power Supply section of the PowerFlex 700 Adjustable Frequency AC Drive - Frames 7...10 Installation Instructions, publication [20B-IN014](#).

(1) Jumper-selectable +5/12V is available on PowerFlex 700 Drive ENC-1 encoder boards.

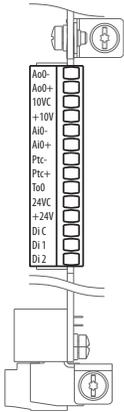

(2) Z channel can be used as a pulse input while A and B are used for encoder.

- (1) Digital Inputs are either 24 Volts DC (2262C) or 115 Volts AC (2262D) based on module catalog number. Ensure applied voltage is correct for I/O module.
- (2) Differential Isolation—external source must be maintained at less than 160V with respect to PE. Input provides high common mode immunity.

## Analog Speed Follower and Preset Speed

### Drive Configuration

The PowerFlex 700 drive will be an Analog Speed Follower, a Preset Speed module, or possibly controlled via a communication network.

The information in this Chapter covers the hardwire stand-alone configurations of Analog Speed Follower and Preset Speed.

### Analog Speed Follower

The PowerFlex 750-Series drive can be configured so an analog source is its speed reference. The default configuration is selected to be Port 1 but the drive can be configured to follow a +/- 10V DC source, 0-10V DC source, or 4-20 mA source with the onboard analog inputs on the PowerFlex 753 drive or with an optional I/O module.

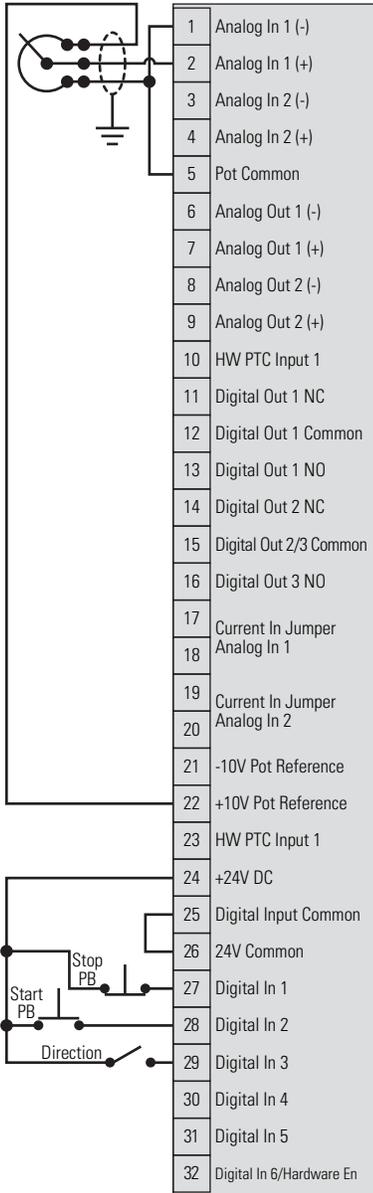

There are three common examples with the PowerFlex 700 drive using different speed-reference inputs along with hardwired Start/Stop/Direction control and the equivalent PowerFlex 750-Series configurations.

### Three-wire Control with Analog Speed Reference

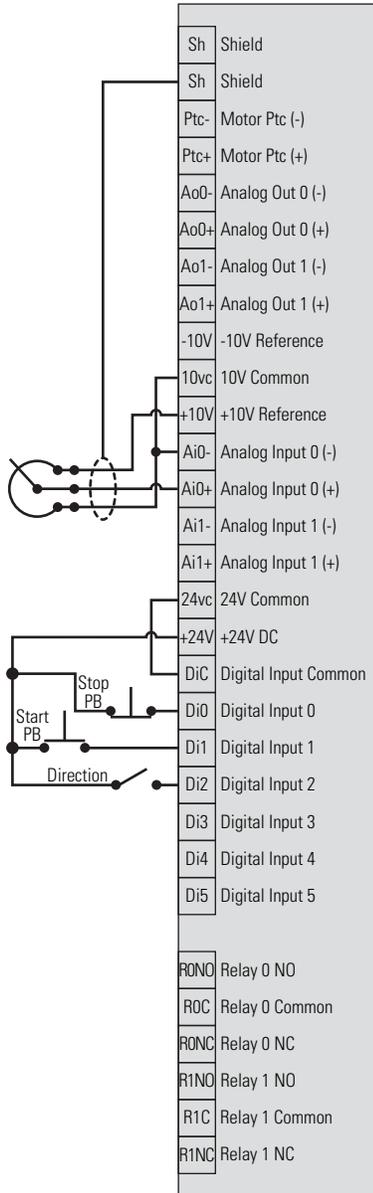

The three-wire control method is Start/Stop/Direction. The digital control inputs use the drive's internal 24V DC supply, and the analog speed follower reference uses a 10K  $\Omega$  potentiometer wired to the drive's internal 10V DC power supply.

### Three-wire Control Parameter Comparison

The following minimum parameters are required to configure the PowerFlex 750-Series drive motor attributes for the three-wire with analog speed reference control method.

**Table 35 - PowerFlex 700 to PowerFlex 753 Drive (using Main Control Board I/O)**

**IMPORTANT** Shaded table cells indicate factory-set default settings. Please verify these settings if the drive is not new or a 'set to factory defaults' was never performed.

(1) The PowerFlex 753 drive offers parameters for speed direction (forward and reverse) that are not available in the PowerFlex 700 series.

'P' in all parentheses is an abbreviation for Parameter.

**TIP** For best possible settings, perform an auto-tune (Rotate Tune) on the connected motor to pair the motor to the drive.

(1) The optional I/O module is installed in slot 4.

(2) The PowerFlex 750-Series drive offers parameters for speed direction (forward and reverse) that are not available in the PowerFlex 700 series.

**TIP** For best possible settings, perform an auto-tune (Rotate Tune) on the connected motor to pair the motor to the drive.

## Two-wire Control with Analog Input Speed Reference

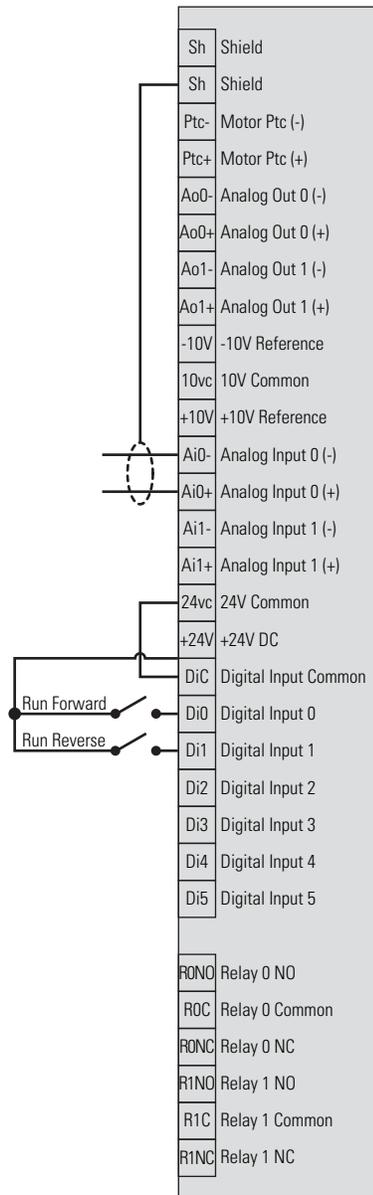

The two-wire control method is Run Fwd/Run Rev. The digital control inputs use the drive's internal 24V DC supply, and the analog input speed comes from a 0...10V or 4...20 mA external reference.

*Two-wire Control Parameter Comparison*

The following minimum parameters are required to configure the PowerFlex 750-Series drive motor attributes for the two-wire with analog speed reference control method.

(1) The PowerFlex 753 drive offers parameters for speed direction (forward and reverse) that are not available in the PowerFlex 700 series.

'P' in all parentheses is an abbreviation for Parameter.

**TIP** For best possible settings, perform an auto-tune (Rotate Tune) on the connected motor to pair the motor to the drive.

**Table 38 - PowerFlex 700 to PowerFlex 750-Series Drive (using optional I/O module)**

**IMPORTANT** Shaded table cells indicate factory-set default settings. Please verify these settings if the drive is not new or a 'set to factory defaults' was never performed.

(1) The optional I/O module is installed in slot 4.

(2) The PowerFlex 750-Series drive offers parameters for speed direction (forward and reverse) that are not available in the PowerFlex 700 series.

'P' in all parentheses is an abbreviation for Parameter.

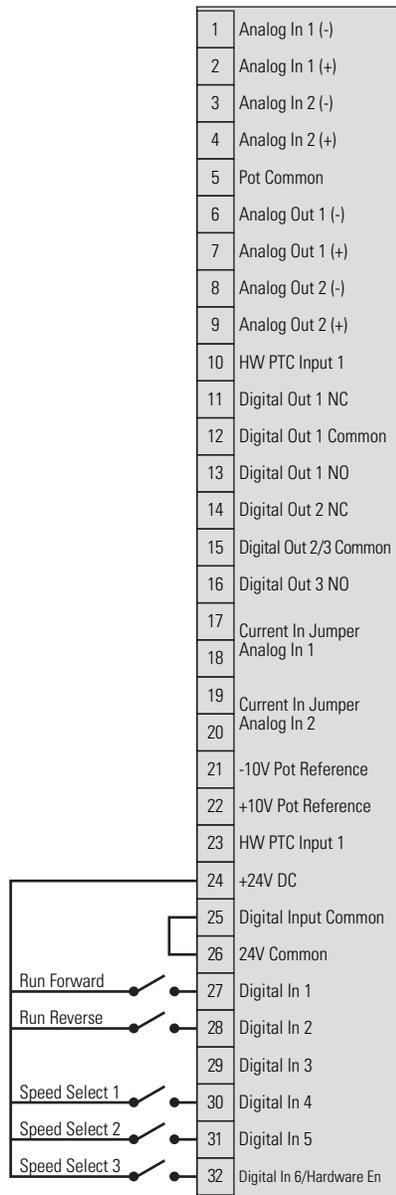

**TIP** For best possible settings, perform an auto-tune (Rotate Tune) on the connected motor to pair the motor to the drive.

## Two-wire Control with Preset Speeds

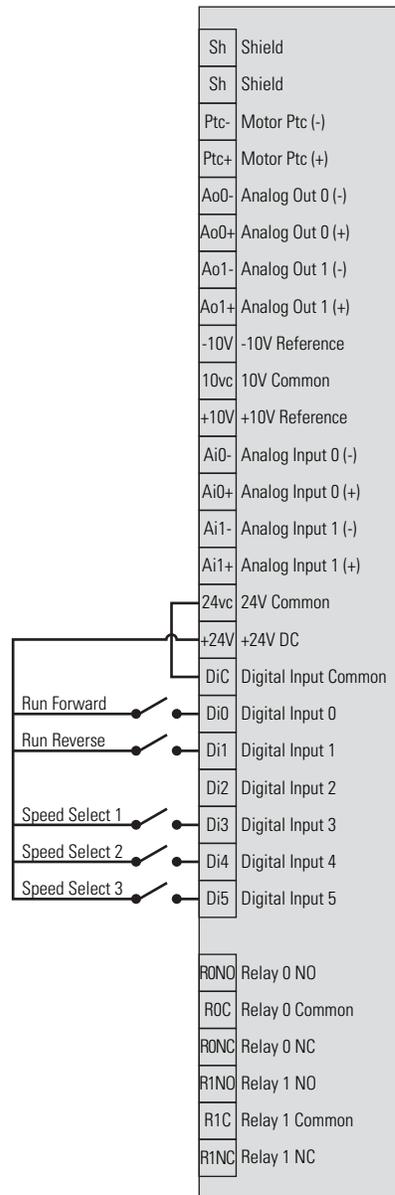

The two-wire control method is Run Fwd/Run Rev with Preset Preference. The digital control inputs use the drive's internal 24V DC supply, and the speed reference is determined by the three speed-select digital inputs.

### *Two-wire Control Parameter Comparison*

The following minimum parameters are required to configure the PowerFlex 750-Series drive motor attributes for the two-wire with analog speed reference control method.

(1) These default selections will vary between PowerFlex drive models and applications. Set these parameters to your specific application needs.

(2) The optional I/O module is installed in slot 4.

(3) The PowerFlex 750-Series drive offers parameters for speed direction (forward and reverse) that are not available in the PowerFlex 700 series.

'P' in all parentheses is an abbreviation for Parameter.

**TIP** For best possible settings, perform an auto-tune (Rotate Tune) on the connected motor to pair the motor to the drive.

**IMPORTANT** Speed-select input functionality changed with the PowerFlex 755 drive, which impacts how a PowerFlex 700 drive is migrated.

**Notes:**

## **Network Communications**

### **Overview**

A PowerFlex 700 drive with a communication option card can be replaced with a PowerFlex 750-Series drive. The process to migrate can vary significantly depending upon the communication option in the PowerFlex 700 drive, the controller type communicating to the drive, and which PowerFlex 750-Series drive model is selected.

This section will show what PowerFlex 700 20-COMM network options can be migrated to the PowerFlex 750-Series drives, and introduce the dedicated communications that are in the PowerFlex 750-Series drives. Because of the wide variety of networks, processors, and drive options to consider, only migration guidelines will be covered instead of step-by-step procedures.

## 20-COMM Carrier Adapters

The following table details what 20-COMM adapters can be used with the PowerFlex 750-Series drives.

### 20-COMM Adapters Compatible with the PowerFlex 750-Series Drives

Most legacy communication adapters (20-COMM) can be used with the PowerFlex 755 drives (with these restrictions):

- **Frame 1** - We recommend that you install catalog number 20-750-20COMM-F1 communication carrier card in port 4. Port 5 is not accessible when this module is installed.
- **Frames 2 and larger** - We recommend that you install catalog number 20-750-20COMM communication carrier card in port 6. If you use port 4 or 5, the adjacent left port is inaccessible to other option modules and can interfere with network cable connections. For details, contact Rockwell Automation technical support.

(1) This product is [discontinued](#).  
 (2) Controller must be able to read/write 32-bit floating point (REAL) values.  
 (3) Supports all three modes of operation (RTU, P1, and N2).  
 (4) Requires this adapter firmware revision or higher.  
 (5) Requires firmware revision 1.05 or later of the drive Add-on Profiles for Studio 5000 Logix Designer® application.  
 (6) Chinese, Japanese, and Korean languages are supported at the time of publication.

## PowerFlex 750-Series Communication Options

The PowerFlex 750-Series drives communication option modules are provided in [Table 42](#). The 750-Series option modules offer more advanced features than the 20-COMM adapters. For additional information, see the PowerFlex 750-Series Drive DeviceNet Option Module User Manual, publication [750COM-UM002](#), and the PowerFlex 20-750-CNETC Coaxial ControlNet Option Module User Manual, publication [750COM-UM003](#).

**Table 42 - 750-Series Communication options**

| Catalog Number | Description                            |
|----------------|----------------------------------------|
| 20-750-BNETIP  | BACnet/IP option module                |
| 20-750-CNET    | Coaxial ControlNet option module       |
| 20-750-DNET    | DeviceNet option module                |
| 20-750-ENETR   | Dual-port EtherNet I/P option module   |
| 20-750-PBUS    | PROFIBUS DPV1 option module            |
| 20-750-PNET    | Single-port Profinet I/O option module |
| 20-750-PNET2P  | Dual-port Profinet I/O option module   |

## PowerFlex 755 Embedded EtherNet/IP Adapter

The PowerFlex 755 drive not only supports a full array of communication options but also has a standard embedded EtherNet/IP adapter. For complete information, refer to the Drive Embedded EtherNet/IP Adapter User Manual, publication [750COM-UM001](#).

## Software Versions

The PowerFlex 750-Series drives use the same software packages as the PowerFlex 700 drives but knowing the software versions of each drive is essential to an effective migration. See the table below.

**Table 43 - PowerFlex 750-Series Drives and Provided Software Versions**

## Velocity Reference/Feedback

The PowerFlex 700 Drive velocity reference and feedback data is represented as scaled values, or a value of 32,767 equates to parameter 55 (Maximum Freq) setting and a value of 0 equates to 0 Hz.

The PowerFlex 750-Series reference and feedback data are in engineering units and are dependent on P300 (Speed Units). A reference of 30.0 equals 30 Hz or 30.0 rpm.

## Using the I/O

The terms input and output are defined from the controller's point of view. Therefore, output I/O is data that is produced by the controller and consumed by the adaptor. Input I/O is status data that is produced by the adaptor and consumed as input by the controller. The I/O image will vary greatly dependent of the communications adaptor and thus user should consult the 'Using the I/O' section of the respective I/O adaptor user manual.

## 16 Bit-based Processors (PLC-5)

The PowerFlex 750-Series drives are 32 bit-based whereas the PLC-5® is 16 bit. Any application that may use a PLC5 with a PowerFlex 750-Series drives should include a review to determine what data will be passed and if the PLC5 can handle this data.

Refer to Rockwell Knowledgebase online document [65712](#), Using 20-COMM with PowerFlex 755 and 753 with a 16-bit controller, for further information.
